<i>Preface</i>	xv
<i>About the author</i>	xxi
<i>Basic notation</i>	xxii
<i>Glossary of main symbols</i>	xxiii
1 Anisotropic elastic media	1
1.1 Strain-energy density and stress-strain relation	1
1.2 Dynamical equations	4
1.2.1 Symmetries and transformation properties	6
Symmetry plane of a monoclinic medium	7
Transformation of the stiffness matrix	9
1.3 Kelvin-Christoffel equation, phase velocity and slowness	10
1.3.1 Transversely isotropic media	11
1.3.2 Symmetry planes of an orthorhombic medium	13
1.3.3 Orthogonality of polarizations	14
1.4 Energy balance and energy velocity	15
1.4.1 Group velocity	17
1.4.2 Equivalence between the group and energy velocities	18
1.4.3 Envelope velocity	20
1.4.4 Example: Transversely isotropic media	20
1.4.5 Elasticity constants from phase and group velocities	22
1.4.6 Relationship between the slowness and wave surfaces	24
SH-wave propagation	24
1.5 Finely layered media	25
1.5.1 The Schoenberg-Muir averaging theory	29
Examples	30
1.6 Anomalous polarizations	33
1.6.1 Conditions for the existence of anomalous polarization	34
1.6.2 Stability constraints	36
1.6.3 Anomalous polarization in orthorhombic media	37
1.6.4 Anomalous polarization in monoclinic media	38
1.6.5 The polarization	38
1.6.6 Example	39
1.7 The best isotropic approximation	42

1.8	Analytical solutions	44
1.8.1	2-D Green function	44
1.8.2	3-D Green function	46
1.9	Reflection and transmission of plane waves	47
1.9.1	Cross-plane shear waves	48
2	Viscoelasticity and wave propagation	55
2.1	Energy densities and stress-strain relations	56
2.1.1	Fading memory and symmetries of the relaxation tensor	58
2.2	Stress-strain relation for 1-D viscoelastic media	59
2.2.1	Complex modulus and storage and loss moduli	59
2.2.2	Energy and significance of the storage and loss moduli	61
2.2.3	Non-negative work requirements and other conditions	61
2.2.4	Consequences of reality and causality	62
2.2.5	Summary of the main properties	64
	Relaxation function	64
	Complex modulus	64
2.3	Wave propagation in 1-D viscoelastic media	65
2.3.1	Wave propagation for complex frequencies	69
2.4	Mechanical models and wave propagation	72
2.4.1	Maxwell model	72
2.4.2	Kelvin-Voigt model	75
2.4.3	Zener or standard linear solid model	78
2.4.4	Burgers model	80
2.4.5	Generalized Zener model	83
	Nearly constant Q	84
2.4.6	Nearly constant- Q model with a continuous spectrum	87
2.5	Constant- Q model and wave equation	87
2.5.1	Phase velocity and attenuation factor	88
2.5.2	Wave equation in differential form. Fractional derivatives	89
	Propagation in Pierre shale	90
2.6	Equivalence between source and initial conditions	91
2.7	Hysteresis cycles and fatigue	93
2.8	Distributed-order fractional time derivatives	96
2.8.1	The β^n case	97
2.8.2	The Generalized Dirac comb function	98
2.9	The concept of centrovLOCITY	98
2.9.1	1-D Green function and transient solution	99
2.9.2	Numerical evaluation of the velocities	100
2.9.3	Example	101
2.10	Memory variables and equation of motion	103
2.10.1	Maxwell model	104
2.10.2	Kelvin-Voigt model	105
2.10.3	Zener model	106
2.10.4	Generalized Zener model	107
3	Isotropic anelastic media	109

3.1	Stress-strain relation	110
3.2	Equations of motion and dispersion relations	110
3.3	Vector plane waves	112
3.3.1	Slowness, phase velocity and attenuation factor	112
3.3.2	Particle motion of the P wave	114
3.3.3	Particle motion of the S waves	116
3.3.4	Polarization and orthogonality	119
3.4	Energy balance, velocity and quality factor	119
3.4.1	P wave	120
3.4.2	S waves	126
3.5	Boundary conditions and Snell law	126
3.6	The correspondence principle	128
3.7	Rayleigh waves	128
3.7.1	Dispersion relation	129
3.7.2	Displacement field	130
3.7.3	Phase velocity and attenuation factor	131
3.7.4	Special viscoelastic solids	132
	Incompressible solid	132
	Poisson solid	132
	Hardtwig solid	132
3.7.5	Two Rayleigh waves	132
3.8	Reflection and transmission of SH waves	133
3.9	Memory variables and equation of motion	136
3.10	Analytical solutions	138
3.10.1	Viscoacoustic media	138
3.10.2	Constant- Q viscoacoustic media	139
3.10.3	Viscoelastic media	140
3.10.4	Pekeris solution for Lamb problem	142
3.11	Constant- Q P- and S-waves	143
3.11.1	Time fractional derivatives	143
3.11.2	Spatial fractional derivatives	144
3.12	Wave equations based on the Burgers model	145
3.12.1	Propagation of P-SV waves	145
3.12.2	Propagation of SH waves	146
3.13	The elastodynamic of a non-ideal interface	146
3.13.1	The interface model	147
	Boundary conditions in differential form	148
3.13.2	Reflection and transmission coefficients of SH waves	148
	Energy loss	150
3.13.3	Reflection and transmission coefficients of P-SV waves	150
	Energy loss	152
	Examples	153
4	Anisotropic anelastic media	157
4.1	Stress-strain relations	158
4.1.1	Model 1: Effective anisotropy	160

4.1.2	Model 2: Attenuation via eigenstrains	161
4.1.3	Model 3: Attenuation via mean and deviatoric stresses	162
4.2	Fracture-induced anisotropic attenuation	164
4.2.1	The equivalent monoclinic medium	165
4.2.2	The orthorhombic equivalent medium	167
4.2.3	HTI equivalent media	168
4.3	Stiffness tensor from oscillatory experiments	170
4.4	Wave velocities, slowness and attenuation vector	173
4.5	Energy balance and fundamental relations	174
4.5.1	Plane waves. Energy velocity and quality factor	177
4.5.2	Polarizations	181
4.6	Propagation of SH waves	182
4.6.1	Energy velocity	182
4.6.2	Group velocity	184
4.6.3	Envelope velocity	184
4.6.4	Perpendicularity properties	185
4.6.5	Numerical evaluation of the energy velocity	187
4.6.6	Forbidden directions of propagation	188
4.7	Wave propagation in symmetry planes	190
4.7.1	Properties of the homogeneous wave	191
4.7.2	Propagation, attenuation and energy directions	192
4.7.3	Phase velocities and attenuations	192
4.7.4	Energy balance, velocity and quality factor	193
4.7.5	Explicit equations in symmetry planes	194
4.8	Memory variables and equation of motion	197
4.8.1	Strain memory variables	198
4.8.2	Memory-variable equations	199
4.8.3	SH equation of motion	200
4.8.4	qP-qSV equation of motion	201
4.9	Analytical solution for SH waves	202
5	The reciprocity principle	205
5.1	Sources, receivers and reciprocity	206
5.2	The reciprocity principle	206
5.3	Reciprocity of particle velocity. Monopoles	207
5.4	Reciprocity of strain	208
5.4.1	Single couples	208
	Single couples without moment	211
	Single couples with moment	211
5.4.2	Double couples	211
	Double couple without moment. Dilatation	211
	Double couple without moment and monopole force	212
	Double couple without moment and single couple	212
5.5	Reciprocity of stress	213
5.6	Reciprocity principle for flexural waves	215
5.6.1	Equation of motion	216

5.6.2	Reciprocity of the deflection	217
5.6.3	Reciprocity of the bending moment	218
6	Reflection and transmission of plane waves	221
6.1	Reflection and transmission of SH waves	222
6.1.1	Symmetry plane of a homogeneous monoclinic medium	222
6.1.2	Complex stiffnesses	224
6.1.3	Reflection and transmission coefficients	225
6.1.4	Propagation, attenuation and energy directions	228
6.1.5	Brewster and critical angles	233
6.1.6	Phase velocities and attenuations	237
6.1.7	Energy-flux balance	239
6.1.8	Energy velocities and quality factors	241
6.2	Reflection and transmission of qP-qSV waves	243
6.2.1	Phase velocities and attenuations	245
6.2.2	Energy-flow balance	245
6.2.3	Reflection of seismic waves	247
6.2.4	Incident inhomogeneous waves	257
	Generation of inhomogeneous waves	258
	Ocean bottom	259
6.3	Interfaces separating a solid and a fluid	261
6.3.1	Solid/fluid interface	261
6.3.2	Fluid/solid interface	263
6.3.3	The Rayleigh window	263
6.4	Scattering coefficients of a set of layers	265
7	Biot theory for porous media	269
7.1	Isotropic media. Stress-strain relations	271
7.1.1	Jacketed compressibility test	271
7.1.2	Unjacketed compressibility test	272
7.2	The concept of effective stress	274
7.2.1	Effective stress in seismic exploration	276
	Pore-volume balance	278
	Acoustic properties	280
7.2.2	Analysis in terms of compressibilities	281
7.3	Pore-pressure build-up in source rocks	284
7.4	The asperity-deformation model	286
7.5	Anisotropic media. Stress-strain relations	290
7.5.1	Effective-stress law for anisotropic media	294
7.5.2	Summary of equations	296
	Pore pressure	296
	Total stress	296
	Effective stress	296
	Skempton relation	296
	Undrained-modulus matrix	296
7.5.3	Brown and Korrington equations	297
	Transversely isotropic medium	297

7.6	Kinetic energy	297
7.6.1	Anisotropic media	300
7.7	Dissipation potential	302
7.7.1	Anisotropic media	303
7.8	Lagrange equations and equation of motion	304
7.8.1	The viscodynamic operator	305
7.8.2	Fluid flow in a plane slit	306
7.8.3	Anisotropic media	311
7.9	Plane-wave analysis	312
7.9.1	Compressional waves	312
	Relation with Terzaghi law	315
	The diffusive slow mode	316
7.9.2	The shear wave	317
7.10	Strain energy for inhomogeneous porosity	319
7.10.1	Complementary energy theorem	319
7.10.2	Volume-averaging method	321
7.11	Boundary conditions	324
7.11.1	Interface between two porous media	325
	Deresiewicz and Skalak's derivation	325
	Gurevich and Schoenberg's derivation	327
7.11.2	Interface between a porous medium and a viscoelastic medium	329
7.11.3	Interface between a porous medium and a viscoacoustic medium	329
7.11.4	Free surface of a porous medium	329
7.12	Squirt-flow dissipation	330
7.13	The mesoscopic loss mechanism. White model	333
7.14	Mesoscopic loss in layered and fractured media	339
7.14.1	Effective fractured medium	341
7.15	Green function for poro-viscoacoustic media	342
7.15.1	Field equations	343
7.15.2	The solution	344
7.16	Green function for a fluid/solid interface	349
7.17	Poro-viscoelasticity	352
7.18	Fluid-pressure diffusion in anisotropic media	354
7.18.1	Biot classical equation and fractional-derivative version	356
7.18.2	Frequency-wavenumber domain analysis	357
7.19	Anisotropy and poro-viscoelasticity	361
7.19.1	Stress-strain relations	362
7.19.2	Biot-Euler equation	363
7.19.3	Time-harmonic fields	364
7.19.4	Inhomogeneous plane waves	366
7.19.5	Homogeneous plane waves	368
7.19.6	Wave propagation in femoral bone	370
7.20	Gassmann equation for a solid pore infill	374
8	The acoustic-electromagnetic analogy	377
8.1	Maxwell equations	379

8.2	The acoustic-electromagnetic analogy	381
8.2.1	Kinematics and energy considerations	385
8.3	A viscoelastic form of the electromagnetic energy	387
8.3.1	Umov-Poynting theorem for harmonic fields	388
8.3.2	Umov-Poynting theorem for transient fields	389
	The Debye-Zener analogy	393
	The Cole-Cole model	397
8.4	The analogy for reflection and transmission	398
8.4.1	Reflection and refraction coefficients	398
	Propagation, attenuation and ray angles	399
	Energy-flux balance	399
8.4.2	Application of the analogy	400
	Refraction index and Fresnel formulae	400
	Brewster (polarizing) angle	401
	Critical angle. Total reflection	402
	Reflectivity and transmissivity	404
	Dual fields	405
	Sound waves	406
8.4.3	The analogy between TM and TE waves	407
	Green analogies	408
8.4.4	Brief historical review	411
8.5	The single-layer problem	412
8.5.1	TM-SH-TE analogy	415
8.5.2	Analogy with quantum mechanics. Tunnel effect	415
8.6	3-D electromagnetic theory and the analogy	417
8.6.1	The form of the tensor components	417
8.6.2	Electromagnetic equations in differential form	418
8.7	Plane-wave theory	420
8.7.1	Slowness, phase velocity and attenuation	422
8.7.2	Energy velocity and quality factor	423
8.8	Electromagnetic diffusion in anisotropic media	427
8.8.1	Differential equations	427
8.8.2	Dispersion relation	428
8.8.3	Slowness, kinematic velocities, attenuation and skin depth	429
8.8.4	Umov-Poynting theorem and energy velocity	430
8.8.5	Fundamental relations	431
8.9	Analytical solution for anisotropic media	432
8.9.1	The solution	433
8.10	Elastic medium with Fresnel wave surface	435
8.10.1	Fresnel wave surface	435
8.10.2	Equivalent elastic medium	436
8.11	Finely layered media	437
8.12	The time-average and CRIM equations	440
8.13	The Kramers-Kronig dispersion relations	441
8.14	The reciprocity principle	442
8.15	Babinet principle	443

8.16	Alford rotation	444
8.17	Cross-property relations	446
8.18	Poro-acoustic and electromagnetic diffusion	448
8.18.1	Poro-acoustic equations	448
8.18.2	Electromagnetic equations	449
	The TM and TE equations	450
	Phase velocity, attenuation factor and skin depth	450
	Analytical solutions	451
8.19	Electro-seismic wave theory	452
9	Numerical methods	455
9.1	Equation of motion	455
9.2	Time integration	456
9.2.1	Classical finite differences	458
9.2.2	Splitting methods	459
9.2.3	Predictor-corrector methods	460
	The Runge-Kutta method	460
	Fractional calculus	460
9.2.4	Spectral methods	461
9.2.5	Algorithms for finite-element methods	462
9.3	Calculation of spatial derivatives	463
9.3.1	Finite differences	463
9.3.2	Pseudospectral methods	465
9.3.3	The finite-element method	467
9.4	Source implementation	468
9.5	Boundary conditions	469
9.6	Absorbing boundaries	470
9.7	Model and modeling design. Seismic modeling	472
9.8	Concluding remarks	475
9.9	Appendix	477
9.9.1	The fractional derivative	477
	Grünwald-Letnikov and central-difference approximations	477
9.9.2	Electromagnetic-diffusion code	479
9.9.3	Finite-differences code for SH waves	483
9.9.4	Finite-difference code for SH (TM) waves	488
9.9.5	Pseudospectral Fourier method	496
	Calculation of fractional derivatives	499
9.9.6	Pseudospectral Chebyshev method	499
9.9.7	Pseudospectral sine/cosine method	501
9.9.8	Earthquake sources. The moment-tensor	503
9.9.9	3-D anisotropic media. Free-surface boundary treatment	505
9.9.10	Modeling in cylindrical coordinates	507
	Equations for axis-symmetric single-phase media	507
	Equations for poroelastic media	509
	<i>Examinations</i>	511
